

The NoPS interface, documented end to end.

NoPS turns uploaded business data into dashboards, forecasts, alerts, and board-ready reports. Its interface has to make deterministic, auditable numbers feel calm and trustworthy – dense analytics without visual noise. This handbook captures the tokens, components, patterns, and experience decisions that make that possible, and closes with a working UX audit of the current build.

React 18 + TypeScript

Tailwind dark-first

Framer Motion

Inter / JetBrains Mono

15 routes

Design principles

Five commitments the product's positioning imposes on every screen. When a design decision is unclear, these break the tie.

TRUST IS THE PRIMARY JOB

Every number is deterministic and reproducible. The UI must never make a computed figure look like a guess — clear provenance, no decorative ambiguity, and a visible separation of *observed data* from *possible cause* from *recommendation*.

CALM DENSITY

Analytics screens are information-dense by nature. Restraint — generous spacing, one accent hue, muted neutrals — keeps them scannable. Color is spent on meaning, not decoration.

SUMMARY BEFORE DETAIL

Screens are operated, not read. KPIs and headline state surface first; tables and raw rows follow. What needs attention reads at a glance through a pill, chip, or delta color.

MOTION WITH A REASON

Physics-based, fast, and purposeful — entrance choreography and micro-interactions that orient the user, never ambient flair for its own sake. Everything collapses gracefully under `prefers-reduced-motion`.

Color

One electric-blue brand ramp, a deliberately hue-biased neutral scale, and a tight semantic set. The dark theme is the design's native home; light is a faithful sibling.

BRAND • **BRAND.***

500 • #3366f5 is the interactive accent (light-mode fills use 600); 400 • #598cff carries the dark theme, where it also drives the neon glow.

SEMANTIC & CHART ACCENTS

Chart series order is fixed: blue • violet • teal • emerald • amber • rose. Revenue is always chart-blue; profit is always emerald. Consistent hue-to-metric mapping means a returning user reads a chart before they read its legend.

NEUTRALS ARE CHOSEN, NOT DEFAULT

Surfaces carry a faint blue bias rather than pure grey • surface.tertiary #f1f3f8 in light, and a near-black #060a13 ground in dark washed with three fixed aurora radial-gradients (blue, violet, cyan). Borders step through #e2e6ef • #eef1f7 • #cdd3e0 so hierarchy survives without heavy lines.

Typography

Inter for everything human-facing, **JetBrains Mono** for data, tokens, and identifiers. Inter's character variants (`cv02â€œcv11`) are enabled for a cleaner single-story `a` and `g`.

display Â· 2.25rem / 800

Revenue is up 12.4%

heading-1 Â· 1.75rem / 700

Quarterly performance

heading-2 Â· 1.375rem / 700

Top products by margin

heading-3 Â· 1.125rem / 600

Forecast confidence

body Â· 0.938rem / 400

Filters live in the URL, so any view you reach is a link you can share with a colleague.

label Â· 0.813rem / 600

DATE RANGE

data-lg Â· 1.75rem / 700 Â· mono context

\$1,284,930

mono Â· 0.813rem / JetBrains Mono

```
SELECT top(customer) ORDER BY revenue DESC
```

Numbers always use `tabular-nums`. In a dashboard, digits line up in columns and update in place; proportional figures jitter on every re-render. This is non-negotiable for KPIs, tables, and deltas.

Space & radius

SPACING SCALE

Standard Tailwind 4px base, extended with a few analytics-specific rhythm stops for card gaps and shell gutters.

gap • card grids	16px (gap-4)
4.5	1.125rem
18	4.5rem
22	5.5rem
30	7.5rem

CORNER RADIUS

Softer as elements grow. Controls are `lg`; cards are `xl`; modals and large surfaces reach `2xl`.

sm • 4	md • 6	lg • 8	xl • 12
--------	--------	--------	---------

Elevation & glow

In light, depth is soft ambient shadow. In dark, flat shadow reads as nothing “ so elevation becomes a hairline white inset ring plus a deep drop, and interactive surfaces gain a brand-blue *glow*.

shadow-card Resting card	shadow-card-hover Hover / focus	shadow-glow Primary action (dark)
-----------------------------	------------------------------------	--------------------------------------

Full shadow set: `card`, `card-hover`, `dropdown`, `modal`, `panel`, `focus`, plus dark-only `glow`, `glow-sm`, `glow-violet`, `card-glow`.

TOKENS

DUR.fast 0.18s

DUR.slow 0.45s

NAMED PATTERNS

- `fadeUp / fadeIn / scaleIn` â€” element entrances
- `Stagger` â€” grid & list choreography (0.06s children)
- `Reveal` â€” scroll-triggered, plays once
- `AnimatedNumber` â€” KPIs count up to value
- Ambient CSS: `aurora`, `float`, `sheen`, `shimmer`

Reduced motion is a first-class path, not a filter. Reveal/Stagger render in their final state immediately; the skeleton shimmer stops; all durations collapse to ~0. Content is never gated behind a scroll trigger that never fires.

07

Buttons

Five variants — three sizes, with a built-in loading state. Hover lifts `-1px`, tap scales to `0.97` — transform is Framer's; only paint properties transition in CSS.

Primary = the one obvious action per view. Danger is reserved for destructive, irreversible operations. Ghost/outline carry secondary and tertiary actions so a screen never shows two competing filled buttons.

08

Forms

Consistent 40px control height, 8px radius, and the shared 3px brand focus ring across `Input`, `Select`, `Textarea`, `Checkbox`, and `Switch`.

Company name	Date range
Northwind Retail	Focus me to see the ring

Focus is the single most important state in a form — it always draws the `0 0 0 3px rgba(51,102,245,.25)` ring plus a brand border, never a bare browser outline.

Data display & KPIs

The heart of the product. KPI tiles animate to value on load; deltas are color-and-arrow coded; charts share the fixed series palette with faint grids and emphasized endpoints.

KPI TILES

CHART LANGUAGE

TABLES

PRODUCT	REGION	REVENUE	MARGIN	STATUS
Aurora Pro	EMEA	\$412,900	44.1%	• Healthy
Nimbus Lite	APAC	\$318,220	28.7%	• Watch
Vertex Max	Americas	\$204,010	12.3%	• Declining

Numeric columns are right-implied via tabular figures; status is encoded in both a colored dot and a word, never color alone.

Feedback & states

Every asynchronous surface owns four states: loading, empty, error, and content. Toasts, modals, badges, tooltips, spinners, and skeletons cover the transitions between them.

BADGES — STATUS AT A GLANCE

● Draft
● Processing
● Complete
● Warning
● Failed

LOADING

Skeletons shimmer via CSS gradient; a `Spinner` with optional label covers whole-page waits.

EMPTY

—

No datasets yet

Upload a CSV to get started.

[Upload data](#)

ERROR

Couldn't load analytics

The request timed out. Your data is safe.

[Retry](#)

Toasts stack bottom-anchored with tone icons (success / error / info); a route-level `ErrorBoundary` catches render failures so a broken chart never blanks the whole app.

Navigation components

TABS

Overview Quality Schema

Underline-style tab set with an animated active indicator.

DROPDOWN & PAGINATION

A focus-trapped `Dropdown` with `DropdownItem`s for row and account menus, plus a compact `Pagination` control for long tables.

Information architecture

The app shell is a persistent dark sidebar (grouped into *Main*, *Analytics*, *Settings*) plus a glass top bar carrying breadcrumb, global search, and account actions. Navigation is grouped by *job*, not by data model.

MAIN

- Dashboard
- Builder
- Data
- Analytics
- Chat with Data

ANALYTICS

- Forecasts
- Chart library
- Reports
- Alerts

SETTINGS

- Settings (tabbed)
- Profile

Public routes (Landing, Login, Signup, Forgot/Reset password) live outside the shell. The active nav item gets a brand tint plus a 3px inset accent bar; on mobile the sidebar collapses to a slide-over.

Page inventory

Fifteen routes, each with a defined job and primary action.

ROUTE	PAGE	JOB TO BE DONE
/	Landing	Explain the deterministic value prop; drive signup
/login · /signup	Auth	Enter the product; forgot / reset password
/dashboard	Dashboard	KPIs + trends the moment you land
/builder	Dashboard Builder	Compose a custom dashboard from widgets
/data	Data List	Browse uploaded datasets; upload new
/data/:id	Dataset Detail	Profile, quality issues, schema, cleaning
/analytics	Analytics	Filter, explore, export; shareable URL state
/charts	Chart Library	Browse the full chart catalog
/ai-chat	Chat with Data	Ask questions in plain English
/forecasts	Forecasts	Trend + 95% confidence band
/reports	Reports	Executive report + PDF export
/alerts	Alerts	Revenue / profit / inventory / forecast alerts
/settings	Settings	Profile, users, API keys, theme
/profile	Profile	Personal account details

Key experience flows

FIRST-RUN → FIRST INSIGHT

1. Sign up → guided `Onboarding`
2. Drag-drop a CSV/XLSX (or use sample retail data)
3. Automatic parse, profile & quality check
4. Schema detected → dashboard renders
5. KPIs count up; trends reveal on scroll

The sample dataset guarantees a populated dashboard even before the user uploads anything → no empty first impression.

ASK A QUESTION

1. Type plain English in Chat with Data
2. Question → structured intent (AI or rules)
3. Deterministic engine computes the answer
4. Result renders as a KPI, table, or chart

The UI reinforces trust: it shows the interpreted intent, and every figure traces to reproducible code, never a model.

Accessibility

BUILT IN

- Visible 3px focus ring on every interactive element via `:focus-visible`
- `prefers-reduced-motion` honored globally and per-component
- Status encoded in shape + text, not color alone
- Semantic color-scheme declaration for native form controls
- Dark and light themes both ship, persisted to `localStorage`

VERIFY PER SCREEN

- Contrast of muted text on dark ground (`slate-400` on `#060a13`) at small sizes
- Chart series distinguishable without color (patterns / labels)
- Keyboard reach into Dropdown, Modal focus-trap, and the mobile slide-over
- Screen-reader labels on icon-only buttons and KPI deltas

UX audit

A working assessment of the current build against the principles above. Each finding is tagged **keep** a proven strength, **watch** a risk to verify, or **fix** a concrete gap.

Trust is designed, not claimed

keep

Separating observed data / possible cause / recommendation in insights, and showing interpreted intent before answers, turns "deterministic and auditable" from a tagline into a felt UI property. This is the product's strongest differentiator – protect it in every new surface.

One coherent visual system

keep

Centralized tokens (tailwind config + `index.css`) and a single motion source mean the whole app moves and looks as one. The barrel-split `ui.*.tsx` primitives keep the component surface small and consistent.

Shareable URL state

keep

Analytics filters living in the URL is a high-value, low-cost collaboration feature that most dashboards miss. Extend the same pattern to Forecasts and Chart Library.

Dark-mode contrast on muted text

watch

`slate-400` / `slate-500` body copy over the `#060a13` aurora ground can dip below WCAG AA at `body-sm` and `label` sizes, especially where an aurora gradient lightens the background locally. Audit with a contrast checker over the actual gradient, not a flat swatch.

Chart accessibility beyond color

watch

The six-hue series palette is distinct for typical vision but blue/violet and teal/emerald pairs can collapse under deuteranopia. Add direct labels, dash patterns, or a texture fallback for multi-series charts and donuts.

Motion budget on data-heavy pages

watch

Stagger entrances + AnimatedNumber count-ups + ambient aurora are delightful once, but on a dashboard the user reloads twenty times a day they can start to feel slow. Consider a "first visit only" or session-scoped entrance so returning views are instant.

Empty and error states need a full pass

fix

`EmptyState` and `ErrorState` exist, but confirm every async surface (Forecasts, Alerts, Reports, Chat) actually renders them â€” with a specific recovery action, not a generic "try again". Errors should say what went wrong *and* what to do.

Icon-only controls need labels

fix

Sidebar toggles, pagination arrows, and row-action dropdowns rendered as bare icons need `aria-label`s and a tooltip so both screen-reader and mouse users know what they do.

Table density controls

fix

Analytics data tables will grow long. Sticky headers, a comfortable/compact density toggle, and per-column sort indicators are missing pieces that materially affect scanning large result sets.

Heuristic scorecard

Nielsen's heuristics scored 14/5 against the current build. A snapshot, not a certification – pair with real usability testing.

HEURISTIC	SCORE	NOTE
Visibility of system status	4 / 5	Strong loading/skeleton coverage; verify long async jobs surface progress
Match to the real world	5 / 5	Nav grouped by job; plain-English querying
User control & freedom	4 / 5	URL state + non-destructive cleaning; add undo affordances
Consistency & standards	5 / 5	Centralized tokens and primitives
Error prevention	4 / 5	Original files never mutated; validate destructive confirms
Recognition over recall	4 / 5	Fixed hue-to-metric mapping; global search
Flexibility & efficiency	4 / 5	Builder + shareable views; add keyboard shortcuts
Aesthetic & minimalist design	5 / 5	Calm density is a genuine strength
Help users with errors	3 / 5	Make every error state actionable and specific
Help & documentation	3 / 5	Onboarding exists; add contextual empty-state guidance

Prioritized roadmap

Ordered by impact-over-effort from the audit findings.

NOW

- Complete empty/error state coverage with specific recovery actions
- `aria-label` every icon-only control
- Contrast audit of muted text over the aurora ground

NEXT

- Table density toggle + sticky headers + sort indicators
- Colorblind-safe chart patterns / direct labels
- Session-scoped entrance motion for returning views

LATER

- Command palette / keyboard shortcuts
- URL state for Forecasts & Chart Library
- Contextual in-product help on empty states

NoPS UI/UX Handbook Â· derived from `apps/web` â€” tailwind config, `index.css`, `lib/motion.tsx`, and the `ui.*` primitives. Styled in the product's own design language. Toggle the theme (top-right) to see both palettes resolve.
